A Conjugate Gradient Algorithm For

In mathematics, the conjugate gradient method is an algorithm for the numerical solution of particular systems of linear equations, namely those whose matrix is symmetric and positive-definite. The conjugate gradient method is often implemented as an iterative algorithm , applicable to sparse systems that are too large to be handled by a direct implementation or other direct methods such as the Cholesky decomposition .

Preconditioned conjugate gradient algorithm • idea: apply CG after linear change of coordinates $x = Ty$, $\det T \neq 0$

Conjugate Gradient Method - Stanford University

In this paper, a three-term conjugate gradient algorithm is developed for solving large-scale unconstrained optimization problems. The search direction at each iteration of the algorithm is determined by rectifying the steepest descent direction with the difference between the current iterative points and that between the gradients.

The conjugate gradient method is a mathematical technique that can be useful for the optimization of both linear and non-linear systems. This technique is generally used as an iterative algorithm, however, it can be used as a direct method, and it will produce a numerical solution.

Conjugate gradient methods - optimization

The paper introduces a variation of a conjugate gradient method (Scaled Conjugate Gradient, SCG), which avoids the line-search per learning iteration by using a Levenberg-Marquardt approach [2] in order to scale the step size. 1 Johansson, Dowla and Goodman suggest several variations of a standard conjugate gradient algorithm. The variations ...

The Conjugate Gradient Method is the most prominent iterative method for solving sparse systems of linear equations. Unfortunately, many textbook treatments of the topic are written with neither illustrations nor intuition, and their victims can be found to this day babbling senselessly in the corners of dusty libraries.

An Introduction to the Conjugate Gradient Method Without ...

Whereas linear conjugate gradient seeks a solution to the linear equation $Ax = b$, the nonlinear conjugate gradient method is generally used to find the local minimum of a nonlinear function using its gradient ∇ alone. It works when the function is approximately quadratic near the minimum, which is the case when the function is twice differentiable at the minimum and the second derivative is non-singular there.

Our over- all goal in developing the conjugate gradient algorithm is to construct consecutive search directions that meet condition (5) without explicit computation of the large Hessian matrix (H).

Conjugate gradient algorithm for training neural networks

The conjugate gradient algorithm is increasingly famous because of its simplicity and low requirement of calculation machine. In general, a good conjugate gradient algorithm optimization algorithm includes a good conjugate gradient direction and an inexact line search technique (see [14-18]). At present, the conjugate gradient algorithm is ...

The conjugate gradient method is a conjugate direction method ! Selects the successive direction vectors as a conjugate version of the successive gradients obtained as the method progresses. ! The conjugate directions are not specified beforehand, but rather are determined sequentially at each step of the iteration.

Functions The conjugate gradient method aims to solve a system of linear equations, $Ax=b$, where A is symmetric, without calculation of the inverse of A . It only requires a very small amount of memory, hence is particularly suitable for large scale systems. It is faster than other approach such as Gaussian elimination if A is well-conditioned.
