## **Marine Outboard Engine Cooling System**

By Ed Sherman. February 21, 2017. In the old days, many marine engine cooling systems were of the “raw-water” variety, meaning simply that they relied on pumping whatever water the boat was floating in through the engine and pumping it out the exhaust system—salt water, polluted water, algae-infested water, whatever was available.

The cooling system on an outboard is a very simple and compact application. Water is inducted through the lower unit by a water pump impeller, and then forced upward to circulate throughout the powerhead, and eventually exits through the exhaust system. There are a couple of things pertaining to the outboard cooling system that need regular maintenance, or require attention from time to time.

as they do not actually circulate freshwater but an antifreeze/water mixture. Unlike in a car where the antifreeze/water circulates through an air-cooled radiator, a closed cooling system uses lake or ocean water flowing through a heat exchanger to remove heat from the engines cooling water/antifreeze mixture.

key to fix outboard engine problems before they cause serious damage. By Rupert Holmes. February 7, 2017. Outboard engine troubleshooting is a handy skill. While a fuel system problem may make it impossible to start the engine, outboard cooling system problems have the potential to destroy an otherwise healthy motor as overheating can lead to a blown cylinder head gasket, or even complete seizure of the engine.

## **Outboard engine cooling system problems - boats.com**

The first order of business is coolant, one of those things that an outboard owner doesn't have to mess with. Any engine that's fresh-water-cooled has a closed loop of coolant that removes heat and is in turn cooled by raw water pulled from the surrounding environment and passed through a heat exchanger.

Normal marine fresh water cooling systems allow the engine to operate at temperatures moderately above 160 degrees F. However, as the heat exchanger accumulates time the system may begin to operate in the range of 170 degrees F. NOTE - In most marine cooling systems a normally functioning system should never allow the engine to operate at temperatures in excess of 180 degrees F.
